

Using Kaggle Instructions

The first step for using Kaggle is creating an account. To do so, you can access the [Kaggle](#) homepage and click on the register option.

Please use your university student email address as your *username* and your Student ID as your *display name*.

We will only consider submissions under the correct Student ID. All the other submissions are considered fake and will be ignored.

The COMP90049 2019SM2 Project2 is *private* competition, so only people who have access to [this](#) link can participate.

After accessing the competition page, you need to "Join" the competition by clicking on the option on the top-right corner. After that, you would be able to "Submit Predictions" using the provided option.

Your prediction file needs to be in CSV format, with precisely two columns and 32978 rows. Your file should have a header row: {tweet-id, state} and 32977 prediction rows.

If your prediction file has the correct format, the site will give you a score (the accuracy of your predictions using 30% of the data). And you can also find the ranking of your results using the public leader board.

Please remember that you can only submit up to 7 predictions on each day. Do NOT make submissions to Kaggle through "fake" usernames to get around the daily Kaggle submission limit (doing otherwise is against Kaggle terms of use, and COMP90049 rules).
